* with this program; if not, write to the Free Software Foundation, Inc.,
* 675 Mass Ave, Cambridge, MA 02139, USA.

* FILENAME:

* xbuf_descriptor.h

* DESCRIPTION:

* This file contains the interface for the XBufDescriptor component.
* The XBufDescriptor component is a passive component that only maps over
* a buffer descriptor data structure shared by the scatter gather DMA hardware
* and software. The component's primary purpose is to provide encapsulation of
* the buffer descriptor processing. See the source file xbuf_descriptor.c for
* details.

* NOTES:

* Most of the functions of this component are implemented as macros in order
* to optimize the processing. The names are not all uppercase such that they
* can be switched between macros and functions easily.

* 675 Mass Ave, Cambridge, MA 02139, USA.

* FILENAME:

*
* xdma_channel.h

* DESCRIPTION:

* This file contains the DMA channel component implementation. This component
* supports a distributed DMA design in which each device can have it's own
* dedicated DMA channel, as opposed to a centralized DMA design.
* A device which uses DMA typically contains two DMA channels, one for
* sending data and the other for receiving data.

* This component is designed to be used as a basic building block for
* designing a device driver. It provides registers accesses such that all
* DMA processing can be maintained easier, but the device driver designer
* must still understand all the details of the DMA channel.

* The DMA channel allows a CPU to minimize the CPU interaction required to move
* data between a memory and a device. The CPU requests the DMA channel to
* perform a DMA operation and typically continues performing other processing
* until the DMA operation completes. DMA could be considered a primitive form
* of multiprocessing such that caching and address translation can be an issue.

* Scatter Gather Operations

* The DMA channel may support scatter gather operations. A scatter gather
* operation automates the DMA channel such that multiple buffers can be
* sent or received with minimal software interaction with the hardware. Buffer
* descriptors, contained in the XBufDescriptor component, are used by the

* scatter gather operations of the DMA channel to describe the buffers to be processed.

* Scatter Gather List Operations

* A scatter gather list may be supported by each DMA channel. The scatter gather list allows buffer descriptors to be put into the list by a device driver which requires scatter gather. The hardware processes the buffer descriptors which are contained in the list and modifies the buffer descriptors to reflect the status of the DMA operations. The device driver is notified by interrupt that specific DMA events occur including scatter gather events. The device driver removes the completed buffer descriptors from the scatter gather list to evaluate the status of each DMA operation.

* The scatter gather list is created and buffer descriptors are inserted into the list. Buffer descriptors are never removed from the list after it's creation such that a put operation copies from a temporary buffer descriptor to a buffer descriptor in the list. Get operations don't copy from the list to a temporary, but return a pointer to the buffer descriptor in the list. A buffer descriptor in the list may be locked to prevent it from being overwritten by a put operation. This allows the device driver to get a descriptor from a scatter gather list and prevent it from being overwritten until the buffer associated with the buffer descriptor has been processed.

* Typical Scatter Gather Processing

* The following steps illustrate the typical processing to use the scatter gather features of a DMA channel.

- * 1. Create a scatter gather list for the DMA channel which puts empty buffer descriptors into the list.
- * 2. Create buffer descriptors which describe the buffers to be filled with receive data or the buffers which contain data to be sent.
- * 3. Put buffer descriptors into the DMA channel scatter list such that scatter

*

* FILENAME:

* xdma_channel_sg.c
*

* DESCRIPTION:

* This file contains the implementation of the XDmaChannel component which is
* related to scatter gather operations.
*

* Scatter Gather Operations
*

* The DMA channel may support scatter gather operations. A scatter gather
* operation automates the DMA channel such that multiple buffers can be
* sent or received with minimal software interaction with the hardware. Buffer
* descriptors, contained in the XBufDescriptor component, are used by the
* scatter gather operations of the DMA channel to describe the buffers to be
* processed.
*

* Scatter Gather List Operations

*

* A scatter gather list may be supported by each DMA channel. The scatter
* gather list allows buffer descriptors to be put into the list by a device
* driver which requires scatter gather. The hardware processes the buffer
* descriptors which are contained in the list and modifies the buffer
* descriptors to reflect the status of the DMA operations. The device driver
* is notified by interrupt that specific DMA events occur including scatter
* gather events. The device driver removes the completed buffer descriptors
* from the scatter gather list to evaluate the status of each DMA operation.

*

* The scatter gather list is created and buffer descriptors are inserted into
* the list. Buffer descriptors are never removed from the list after it's
* creation such that a put operation copies from a temporary buffer descriptor
* to a buffer descriptor in the list. Get operations don't copy from the list
* to a temporary, but return a pointer to the buffer descriptor in the list.
* A buffer descriptor in the list may be locked to prevent it from being
* overwritten by a put operation. This allows the device driver to get a
* descriptor from a scatter gather list and prevent it from being overwritten
* until the buffer associated with the buffer descriptor has been processed.

*

* The get and put functions only operate on the list and are asynchronous from
* the hardware which may be using the list of descriptors. This is important
* because there are no checks in the get and put functions to ensure that the
* hardware has processed the descriptors. This must be handled by the driver
* using the DMA scatter gather channel through the use of the other functions.
* When a scatter gather operation is started, the start function does ensure
* that the descriptor to start has not already been processed by the hardware
* and is not the first of a series of descriptors that have not been committed
* yet.

*

* Descriptors are put into the list but not marked as ready to use by the
* hardware until a commit operation is done. This allows multiple descriptors
* which may contain a single packet of information for a protocol to be
* guaranteed not to cause any underflow conditions during transmission. The
* hardware design only allows descriptors to cause it to stop after a descriptor
* has been processed rather than before it is processed. A series of
* descriptors are put into the list followed by a commit operation, or each
* descriptor may be committed. A commit operation is performed by changing a
* single descriptor, the first of the series of puts, to indicate that the
* hardware may now use all descriptors after it. The last descriptor in the
* list is always set to cause the hardware to stop after it is processed.

*

* Typical Scatter Gather Processing

*

* FILENAME:

*

* xipif.c

*

* DESCRIPTION:

*

* This file contains the implementation of the XIpIf component. The XIpIf component encapsulates the IPIF, which is the standard interface that IP must adhere to when connecting to a bus. The purpose of this component is to encapsulate the IPIF processing such that maintainability is increased. This component does not provide a lot of abstraction from the details of the IPIF as it is considered a building block for device drivers. A device driver designer must be familiar with the details of the IPIF hardware to use this component.

*

* The IPIF hardware provides a building block for all hardware devices such that each device does not need to reimplement these building blocks. The IPIF contains other building blocks, such as FIFOs and DMA channels, which are also common to many devices. These blocks are implemented as separate hardware blocks and instantiated within the IPIF. The primary hardware of the IPIF which is implemented by this software component is the interrupt architecture. Since there are many blocks of a device which may generate interrupts, all the interrupt processing is contained in the common part of the device, the IPIF. This interrupt processing is for the device level only and does not include any processing for the interrupt controller.

*

* A device is a mechanism such as an Ethernet MAC. The device is made up of several parts which include an IPIF and the IP. The IPIF contains most of the device infrastructure which is common to all devices, such as interrupt processing, DMA channels, and FIFOs. The infrastructure may also be referred to as IPIF internal blocks since they are part of the IPIF and are separate blocks that can be selected based upon the needs of the device. The IP of the device is the logic that is unique to the device and interfaces to the IPIF of the device.

*

* In general, there are two levels of registers within the IPIF. The first level, referred to as the device level, contains registers which are for the entire device. The second level, referred to as the IP level, contains registers which are specific to the IP of the device. The two levels of registers are designed to be hierarchical such that the device level is a more general register set above the more specific registers of the IP. The IP level of registers provides functionality which is typically common across all devices and allows IP designers to focus on the unique aspects of the IP.

*

* The interrupt registers of the IPIF are parameterizable such that the only the number of bits necessary for the device are implemented. The functions

* of this component do not attempt to validate that the passed in arguments are
* valid based upon the number of implemented bits. This is necessary to
* maintain the level of performance required for the common components. Bits
* of the registers are assigned starting at the least significant bit of the
* registers.

* Critical Sections

* It is the responsibility of the device driver designer to use critical
* sections as necessary when calling functions of the IPIF. This component
* does not use critical sections and it does access registers using
* read-modify-write operations. Calls to IPIF functions from a main thread
* and from an interrupt context could produce unpredictable behavior such that
* the caller must provide the appropriate critical sections.

* Mutual Exclusion

* The functions of the IPIF are not thread safe such that the caller of all
* functions is responsible for ensuring mutual exclusion for an IPIF. Mutual
* exclusion across multiple IPIF components is not necessary.

* NOTES:

* None.

/*****/
/*

* @file xpacket_fifo_v1_00_b.h

* This component is a common component because it's primary purpose is to
* prevent code duplication in drivers. A driver which must handle a packet
* FIFO uses this component rather than directly manipulating a packet FIFO.

* A FIFO is a device which has dual port memory such that one user may be
* inserting data into the FIFO while another is consuming data from the FIFO.
* A packet FIFO is designed for use with packet protocols such as Ethernet and
* ATM. It is typically only used with devices when DMA and/or Scatter Gather
* is used. It differs from a nonpacket FIFO in that it does not provide any
* interrupts for thresholds of the FIFO such that it is less useful without
* DMA.

* @note

* This component has the capability to generate an interrupt when an error
* condition occurs. It is the user's responsibility to provide the interrupt
* processing to handle the interrupt. This component provides the ability to
* determine if that interrupt is active, a deadlock condition, and the ability
* to reset the FIFO to clear the condition. In this condition, the device which
* is using the FIFO should also be reset to prevent other problems. This error

* condition could occur as a normal part of operation if the size of the FIFO
* is not setup correctly. See the hardware IP specification for more details.

/**
 *
 * @file xiic_1.c
 *
 * This file contains low-level driver functions that can be used to access the
 * device. The user should refer to the hardware device specification for more
 * details of the device operation.
 *
 * <pre>
 * MODIFICATION HISTORY:
 *
 * Ver    Who    Date      Changes
 * -----
 * 1.01b  jhl    5/13/02   First release
 * 1.01b  jhl    10/14/02  Corrected bug in the receive function, the setup of the
 *                          interrupt status mask was not being done in the loop such
 *                          that a read would sometimes fail on the last byte because
 *                          the transmit error which should have been ignored was
 *                          being used. This would leave an extra byte in the FIFO
 *                          and the bus throttled such that the next operation would
 *                          also fail. Also updated the receive function to not
 *                          disable the device after the last byte until after the
 *                          bus transitions to not busy which is more consistent
 *                          with the expected behavior.
 * 1.01c  ecm    12/05/02  new rev

*  
* Comments:  
*  
* After relocating the code, the environment variable "loglevel" is  
* copied to console_loglevel. The functionality is similar to the  
* handling in the Linux kernel, i.e. messages logged with a priority  
* less than console_loglevel are also output to stdout.  
*  
* If you want messages with the default level (e.g. POST messages) to  
* appear on stdout also, make sure the environment variable  
* "loglevel" is set at boot time to a number higher than  
* default_message_loglevel below.

```
*****
*
```

```

* Lots of code copied from:
*
* m8xx_pcmcia.c - Linux PCMCIA socket driver for the mpc8xx series.
* (C) 1999-2000 Magnus Damm <damm@bitSMART.com>
*
* "The ExCA standard specifies that socket controllers should provide
* two IO and five memory windows per socket, which can be independently
* configured and positioned in the host address space and mapped to
* arbitrary segments of card address space. " - David A Hinds. 1999
*
* This controller does not meet the ExCA standard.
*
* m8xx pcmcia controller brief info:
* + 8 windows (attrib, mem, i/o)
* + up to two slots (SLOT_A and SLOT_B)
* + inputpins, outputpins, event and mask registers.
* - no offset register. sigh.
*
* Because of the lacking offset register we must map the whole card.
* We assign each memory window PCMCIA_MEM_WIN_SIZE address space.
* Make sure there is (PCMCIA_MEM_WIN_SIZE * PCMCIA_MEM_WIN_NO
* * PCMCIA_SOCKETS_NO) bytes at PCMCIA_MEM_WIN_BASE.
* The i/o windows are dynamically allocated at PCMCIA_IO_WIN_BASE.
* They are maximum 64KByte each...

/*
* sh.c -- a prototype Bourne shell grammar parser
```

```

*      Intended to follow the original Thompson and Ritchie
*      "small and simple is beautiful" philosophy, which
*      incidentally is a good match to today's BusyBox.
*
* Copyright (C) 2000,2001 Larry Doolittle <larry@doolittle.boa.org>
*
* Credits:
*   The parser routines proper are all original material, first
*   written Dec 2000 and Jan 2001 by Larry Doolittle.
*   The execution engine, the builtins, and much of the underlying
*   support has been adapted from busybox-0.49pre's lash,
*   which is Copyright (C) 2000 by Lineo, Inc., and
*   written by Erik Andersen <andersen@lineo.com>, <andersee@debian.org>.
*   That, in turn, is based in part on ladsh.c, by Michael K. Johnson and
*   Erik W. Troan, which they placed in the public domain. I don't know
*   how much of the Johnson/Troan code has survived the repeated rewrites.
* Other credits:
*   b_addchr() derived from similar w_addchar function in glibc-2.2
*   setup_redirect(), redirect_opt_num(), and big chunks of main()
*   and many builtins derived from contributions by Erik Andersen
*   miscellaneous bugfixes from Matt Kraai
*
* There are two big (and related) architecture differences between
* this parser and the lash parser. One is that this version is
* actually designed from the ground up to understand nearly all
* of the Bourne grammar. The second, consequential change is that
* the parser and input reader have been turned inside out. Now,
* the parser is in control, and asks for input as needed. The old
* way had the input reader in control, and it asked for parsing to
* take place as needed. The new way makes it much easier to properly
* handle the recursion implicit in the various substitutions, especially
* across continuation lines.
*
* Bash grammar not implemented: (how many of these were in original sh?)
*   $@ (those sure look like weird quoting rules)
*   $_
*   ! negation operator for pipes
*   &> and >& redirection of stdout+stderr
*   Brace Expansion
*   Tilde Expansion
*   fancy forms of Parameter Expansion
*   aliases
*   Arithmetic Expansion
*   <(list) and >(list) Process Substitution
*   reserved words: case, esac, select, function
*   Here Documents ( << word )
*   Functions
* Major bugs:
*   job handling woefully incomplete and buggy
*   reserved word execution woefully incomplete and buggy

```

```
* to-do:
*   port selected bugfixes from post-0.49 busybox lash - done?
*   finish implementing reserved words: for, while, until, do, done
*   change { and } from special chars to reserved words
*   builtins: break, continue, eval, return, set, trap, ulimit
*   test magic exec
*   handle children going into background
*   clean up recognition of null pipes
*   check setting of global_argc and global_argv
*   control-C handling, probably with longjmp
*   follow IFS rules more precisely, including update semantics
*   figure out what to do with backslash-newline
*   explain why we use signal instead of sigaction
*   propagate syntax errors, die on resource errors?
*   continuation lines, both explicit and implicit - done?
*   memory leak finding and plugging - done?
*   more testing, especially quoting rules and redirection
*   document how quoting rules not precisely followed for variable assignments
*   maybe change map[] to use 2-bit entries
*   (eventually) remove all the printf's
*

* Description: Module implementing the system specific functions. This
* module is always compiled and linked in the OS dependent
* libraries, and never in a binary portable driver.

Jason ported this file to u-boot to run the ATI video card BIOS
in u-boot. Made all the video memory be emulated during the
BIOS running process which may affect the VGA function but the
frambuffer function can work after run the BIOS.

*

* =====

*

* Language: ANSI C
* Environment: Any
* Developer: Kendall Bennett

*

* Description: This file includes subroutines to implement the decoding
* and emulation of all the x86 processor instructions.

*

* There are approximately 250 subroutines in here, which correspond
* to the 256 byte-"opcodes" found on the 8086. The table which
* dispatches this is found in the files optab.[ch].

*

* Each opcode proc has a comment preceding it which gives it's table
* address. Several opcodes are missing (undefined) in the table.

*

* Each proc includes information for decoding (DECODE_PRINTF and
* DECODE_PRINTF2), debugging (TRACE_REGS, SINGLE_STEP), and misc
* functions (START_OF_INSTR, END_OF_INSTR).

*

* Many of the procedures are *VERY* similar in coding. This has
* allowed for a very large amount of code to be generated in a fairly
* short amount of time (i.e. cut, paste, and modify). The result is
* that much of the code below could have been folded into subroutines
* for a large reduction in size of this file. The downside would be
* that there would be a penalty in execution speed. The file could
* also have been *MUCH* larger by inlining certain functions which
* were called. This could have resulted even faster execution. The
* prime directive I used to decide whether to inline the code or to
* modularize it, was basically: 1) no unnecessary subroutine calls,
* 2) no routines more than about 200 lines in size, and 3) modularize
* any code that I might not get right the first time. The fetch_*
* subroutines fall into the latter category. The The decode_* fall
* into the second category. The coding of the "switch(mod){ }"
* in many of the subroutines below falls into the first category.
* Especially, the coding of {add,and,or,sub,...}_{byte,word}
* subroutines are an especially glaring case of the third guideline.
* Since so much of the code is cloned from other modules (compare
* opcode #00 to opcode #01), making the basic operations subroutine
* calls is especially important; otherwise mistakes in coding an
* "add" would represent a nightmare in maintenance.

*

Environment: Any
Developer: Kendall Bennett

Description: This file contains the code to implement the primitive machine operations used by the emulation code in ops.c

Carry Chain Calculation

This represents a somewhat expensive calculation which is apparently required to emulate the setting of the OF343364 and AF flag. The latter is not so important, but the former is. The overflow flag is the XOR of the top two bits of the carry chain for an addition (similar for subtraction). Since we do not want to simulate the addition in a bitwise manner, we try to calculate the carry chain given the two operands and the result.

So, given the following table, which represents the addition of two bits, we can derive a formula for the carry chain.

a	b	cin	r	cout
0	0	0	0	0

```

* 0  0  1  1  0
* 0  1  0  1  0
* 0  1  1  0  1
* 1  0  0  1  0
* 1  0  1  0  1
* 1  1  0  0  1
* 1  1  1  1  1
*

```

* Construction of table for cout:

```

* ab
* r \ 00  01  11  10
* |-----
* 0 |  0  1  1  1
* 1 |  0  0  1  0
*

```

* By inspection, one gets: $cc = ab + r'(a + b)$

* That represents alot of operations, but NO CHOICE....

* Borrow Chain Calculation.

* The following table represents the subtraction of two bits, from which we can derive a formula for the borrow chain.

```

* a  b  bin  r   bout
* 0  0  0    0   0
* 0  0  1    1   1
* 0  1  0    1   1
* 0  1  1    0   1
* 1  0  0    1   0
* 1  0  1    0   0
* 1  1  0    0   0
* 1  1  1    1   1
*

```

* Construction of table for cout:

```

* ab
* r \ 00  01  11  10
* |-----
* 0 |  0  1  0  0
* 1 |  1  1  1  0
*

```

* By inspection, one gets: $bc = a'b + r(a' + b)$

*
* Language:      ANSI C
* Environment:   Any
* Developer:    Kendall Bennett
*
* Description:   This file includes subroutines which are related to
*               programmed I/O and memory access. Included in this module
*               are default functions that do nothing. For real uses these
*               functions will have to be overridden by the user library.
*

 *
 * To use this driver, in your board's config. header:
 * #define CONFIG_ALTERA_PIO
```

```

* #define CONFIG_SYS_ALTERA_PIO_NUM <number-of-pio-cores>
* #define CONFIG_SYS_ALTERA_PIO_GPIO_NUM <total-number-of-gpios>
* And in your board's early setup routine:
* altera_pio_init(<baseaddr>, <width>, 'i'|'o'|'t',
*               <reset-value>, <neg-mask>, "label");
* - 'i'|'o'|'t': PIO is input-only/output-only/tri-state
* - <reset-value>: for correct initial status display, output-only
* - <neg-mask> is meant to be used to in cases of active-low
*   GPIOs, such as LEDs and buttons (on/pressed == 0). Each bit
*   which is 1 in <neg-mask> inverts the corresponding GPIO's value
*   before set/after get. So: gpio_set_value(gpio, 1) => LED on .
*
* Do NOT define CONFIG_SYS_GPIO_BASE !
*
* Optionally, in your board's config. header:
* - To force a GPIO numbering scheme like in Linux ...
* #define CONFIG_GPIO_DOWNT0_NUMBERING
* ... starting with 255 (default)
* #define CONFIG_GPIO_DOWNT0_MAX 255
*/

```

/*
```

```
* drivers/mtd/nand.c
*
* Overview:
* This is the generic MTD driver for NAND flash devices. It should be
* capable of working with almost all NAND chips currently available.
* Basic support for AG-AND chips is provided.
*
* Additional technical information is available on
* http://www.linux-mtd.infradead.org/doc/nand.html
```

```
*
* Copyright (C) 2000 Steven J. Hill (sjhill@realitydiluted.com)
*           2002-2006 Thomas Gleixner (tglx@linutronix.de)
*
* Credits:
*   David Woodhouse for adding multichip support
*
*   Aleph One Ltd. and Toby Churchill Ltd. for supporting the
*   rework for 2K page size chips
*
* TODO:
*   Enable cached programming for 2k page size chips
*   Check, if mtd->ecctype should be set to MTD_ECC_HW
*   if we have HW ecc support.
*   The AG-AND chips have nice features for speed improvement,
*   which are not supported yet. Read / program 4 pages in one go.
*   BBT table is not serialized, has to be fixed
*
* This program is free software; you can redistribute it and/or modify
* it under the terms of the GNU General Public License version 2 as

*
*/
```

```
./drivers/mtd/nand/nand_bbt.c
nand_bbt.c
```

```
/*
* drivers/mtd/nand_bbt.c
*
* Overview:
*   Bad block table support for the NAND driver
*
* Copyright (C) 2004 Thomas Gleixner (tglx@linutronix.de)
*
* This program is free software; you can redistribute it and/or modify
* it under the terms of the GNU General Public License version 2 as
* published by the Free Software Foundation.
*
* Description:
*
* When nand_scan_bbt is called, then it tries to find the bad block table
* depending on the options in the BBT descriptor(s). If no flash based BBT
* (NAND_USE_FLASH_BBT) is specified then the device is scanned for factory
* marked good / bad blocks. This information is used to create a memory BBT.
* Once a new bad block is discovered then the "factory" information is updated
* on the device.
* If a flash based BBT is specified then the function first tries to find the
* BBT on flash. If a BBT is found then the contents are read and the memory
* based BBT is created. If a mirrored BBT is selected then the mirror is
* searched too and the versions are compared. If the mirror has a greater
```

```
* version number than the mirror BBT is used to build the memory based BBT.
* If the tables are not versioned, then we "or" the bad block information.
* If one of the BBTs is out of date or does not exist it is (re)created.
* If no BBT exists at all then the device is scanned for factory marked
* good / bad blocks and the bad block tables are created.
*
* For manufacturer created BBTs like the one found on M-SYS DOC devices
* the BBT is searched and read but never created
*
* The auto generated bad block table is located in the last good blocks
* of the device. The table is mirrored, so it can be updated eventually.
* The table is marked in the OOB area with an ident pattern and a version
* number which indicates which of both tables is more up to date. If the NAND
* controller needs the complete OOB area for the ECC information then the
* option NAND_USE_FLASH_BBT_NO_OOB should be used: it moves the ident pattern
* and the version byte into the data area and the OOB area will remain
* untouched.
*
* The table uses 2 bits per block
* 11b:          block is good
* 00b:          block is factory marked bad
* 01b, 10b:    block is marked bad due to wear
*
* The memory bad block table uses the following scheme:
* 00b:          block is good
* 01b:          block is marked bad due to wear
* 10b:          block is reserved (to protect the bbt area)
* 11b:          block is factory marked bad
*
* Multichip devices like DOC store the bad block info per floor.
*
* Following assumptions are made:
* - bbt's start at a page boundary, if autolocated on a block boundary
* - the space necessary for a bbt in FLASH does not exceed a block boundary
*
*/

crc32.c

```

/*
 * Oct 15, 2000 Matt Domsch <Matt_Domsch@dell.com>
 * Nicer crc32 functions/docs submitted by linux@horizon.com. Thanks!
 * Code was from the public domain, copyright abandoned. Code was
 * subsequently included in the kernel, thus was re-licensed under the
 * GNU GPL v2.
 *
 * Oct 12, 2000 Matt Domsch <Matt_Domsch@dell.com>
 * Same crc32 function was used in 5 other places in the kernel.
 * I made one version, and deleted the others.
 * There are various incantations of crc32(). Some use a seed of 0 or ~0.
 * Some xor at the end with ~0. The generic crc32() function takes
 * seed as an argument, and doesn't xor at the end. Then individual
 * users can do whatever they need.
 * drivers/net/smc9194.c uses seed ~0, doesn't xor with ~0.
 * fs/jffs2 uses seed 0, doesn't xor with ~0.
 * fs/partitions/efi.c uses seed ~0, xor's with ~0.
 *
 * This source code is licensed under the GNU General Public License,
 * Version 2. See the file COPYING for more details.
 */

/*-----+
*
* File Name: enetemac.c
*
* Function: Device driver for the ethernet EMAC3 macro on the 405GP.
*
* Author: Mark Wisner
*
* Change Activity-
*
* Date Description of Change BY
* -----
* 05-May-99 Created MKW
* 27-Jun-99 Clean up JWB
* 16-Jul-99 Added MAL error recovery and better IP packet handling MKW
* 29-Jul-99 Added Full duplex support MKW
* 06-Aug-99 Changed names for Mal CR reg MKW
* 23-Aug-99 Turned off SYE when running at 10Mbs MKW
* 24-Aug-99 Marked descriptor empty after call_xlc MKW
* 07-Sep-99 Set MAL RX buffer size reg to ENET_MAX_MTU_ALIGNED / 16 MCG
* to avoid chaining maximum sized packets. Push starting
* RX descriptor address up to the next cache line boundary.

```

```

* 16-Jan-00 Added support for booting with IP of 0x0 MKW
* 15-Mar-00 Updated enetInit() to enable broadcast addresses in the
* EMAC0_RXM register. JWB
* 12-Mar-01 anne-sophie.harnois@nextream.fr
* - Variables are compatible with those already defined in
* include/net.h
* - Receive buffer descriptor ring is used to send buffers
* to the user
* - Info print about send/received/handled packet number if
* INFO_405_ENET is set
* 17-Apr-01 stefan.roese@esd-electronics.com
* - MAL reset in "eth_halt" included
* - Enet speed and duplex output now in one line
* 08-May-01 stefan.roese@esd-electronics.com
* - MAL error handling added (eth_init called again)
* 13-Nov-01 stefan.roese@esd-electronics.com
* - Set IST bit in EMAC0_MR1 reg upon 100MBit or full duplex
* 04-Jan-02 stefan.roese@esd-electronics.com
* - Wait for PHY auto negotiation to complete added
* 06-Feb-02 stefan.roese@esd-electronics.com
* - Bug fixed in waiting for auto negotiation to complete
* 26-Feb-02 stefan.roese@esd-electronics.com
* - rx and tx buffer descriptors now allocated (no fixed address
* used anymore)
* 17-Jun-02 stefan.roese@esd-electronics.com
* - MAL error debug printf 'M' removed (rx de interrupt may
* occur upon many incoming packets with only 4 rx buffers).
*-----*
* 17-Nov-03 travis.sawyer@sandburst.com
* - ported from 405gp_enet.c to utilized upto 4 EMAC ports
* in the 440GX. This port should work with the 440GP
* (2 EMACs) also
* 15-Aug-05 sr@denx.de
* - merged 405gp_enet.c and 440gx_enet.c to generic 4xx_enet.c

/*-----  
* SPI transfer  
*  
* This writes "bitlen" bits out the SPI MOSI port and simultaneously clocks  
* "bitlen" bits in the SPI MISO port. That's just the way SPI works.  
*  
* The source of the outgoing bits is the "dout" parameter and the  
* destination of the input bits is the "din" parameter. Note that "dout"  
* and "din" can point to the same memory location, in which case the  
* input data overwrites the output data (since both are buffered by  
* temporary variables, this is OK).  
*  
* This may be interrupted with Ctrl-C if "intr" is true, otherwise it will  
* never return an error.  
*/

* This program is free software; you can redistribute it and/or modify
* it under the terms of the GNU General Public License as published by
* the Free Software Foundation.

*

* Name: nicext.h

*

* Description: Broadcom Network Interface Card Extension (NICE) is an
* extension to Linux NET device kernel mode drivers.
* NICE is designed to provide additional functionalities,
* such as receive packet intercept. To support Broadcom NICE,
* the network device driver can be modified by adding an
* device ioctl handler and by indicating receiving packets
* to the NICE receive handler. Broadcom NICE will only be

* enabled by a NICE-aware intermediate driver, such as
* Broadcom Advanced Server Program Driver (BASP). When NICE
* is not enabled, the modified network device drivers
* functions exactly as other non-NICE aware drivers.

* Author: Frankie Fan

* Created: September 17, 2000

```

```
* @brief Header file for the IXP400 ATM Traffic Shaper
```

```
*
```

```
* This component demonstrates an ATM Traffic Shaper implementation. It
* will perform shaping on upto 12 ports and total of 44 VCs accross all ports,
* 32 are intended for AAL0/5 and 12 for OAM (1 per port).
* The supported traffic types are;1 rt-VBR VC where PCR = SCR.
* (Effectively CBR) and Up-to 44 VBR VCs.
```

```
*
```

```
* This component models the ATM ports and VCs and is capable of producing
* a schedule of ATM cells per port which can be supplied to IxAtmdAcc
* for execution on the data path.
```

./drivers/net/npe/include/IxEthMii.h

IxEthMii.h

/**

* @file IxEthMii.h

```
*
* @brief this file contains the public API of @ref IxEthMii component
*
* Design notes :
* The main intent of this API is to implement MII high level functionalities
* to support the codelets provided with the IXP400 software releases. It
* supercedes previous interfaces provided with @ref IxEthAcc component.
*
* This API has been tested with the PHYs provided with the
* IXP400 development platforms. It may not work for specific Ethernet PHYs
* used on specific boards.
*
* This source code detects and interface the LXT972, LXT973 and KS6995
* Ethernet PHYs.
*
* This source code should be considered as an example which may need
* to be adapted for different hardware implementations.
*
* It is strongly recommended to use public domain and GPL utilities
* like libmii, mii-diag for MII interface support.
*

* @par
* -- End of Copyright Notice --
* This module contains the implementation of the OS Services buffer pool
* management service. This module provides routines for creating pools
* of buffers for exchange of network data, getting and returning buffers
* from and to the pool, and some other utility functions.
* <P>
* Currently, the pool has 2 underlying implementations - one for the vxWorks
* OS, and another which attempts to be OS-agnostic so that it can be used on
* other OS's such as Linux. The API is largely the same for all OS's,
* but there are some differences to be aware of. These are documented
* in the API descriptions below.
* <P>
* The most significant difference is this: when this module is used with
* the WindRiver VxWorks OS, it will create a pool of vxWorks "MBufs".
* These can be used directly with the vxWorks "netBufLib" OS Library.
* For other OS's, it will create a pool of generic buffers. These may need
* to be converted into other buffer types (sk_buff's in Linux, for example)
* before being used with any built-in OS routines available for
* manipulating network data buffers.
*
* @sa IxOsBuffMgt.h

```
*
```

```
* Some functions contained in this module are inline to achieve better
* data-path performance. For this to work, the function definitions are
* contained in this header file. The "normal" use of inline functions
* is to use the inline functions in the module in which they are
* defined. In this case these inline functions are used in external
* modules and therefore the use of "inline extern". What this means
* is as follows: if a function foo is declared as "inline extern" this
* definition is only used for inlining, in no case is the function
* compiled on its own. If the compiler cannot inline the function it
* becomes an external reference. Therefore in IxQMgrQAccess.c all
* inline functions are defined without the "inline extern" specifier
* and so define the external references. In all other source files
* including this header file, these functions are defined as "inline
* extern".
```

```
/**
```

```
* @file IxQMGrAqmIf_p.h
```

```
*
```

```
* @author Intel Corporation
```

```
* @date 30-Oct-2001
```

```
*
```

```
* @brief The IxQMGrAqmIf sub-component provides a number of inline
* functions for performing I/O on the AQM.
```

```
*
```

```
* Because some functions contained in this module are inline and are
* used in other modules (within the QMgr component) the definitions are
* contained in this header file. The "normal" use of inline functions
```

```
* is to use the inline functions in the module in which they are
* defined. In this case these inline functions are used in external
* modules and therefore the use of "inline extern". What this means
* is as follows: if a function foo is declared as "inline extern" this
* definition is only used for inlining, in no case is the function
* compiled on its own. If the compiler cannot inline the function it
* becomes an external reference. Therefore in IxQMgrAqmIf.c all
* inline functions are defined without the "inline extern" specifier
* and so define the external references. In all other modules these
* funtions are defined as "inline extern".

/**
 * @file IxUART.h
 *
 * @date 12-OCT-01
 *
 * @brief Public header for the Intel IXP400 internal UART, generic driver.
 *
 * Design Notes:
 * This driver allows you to perform the following functions:
 *     Device Initialization,
 *     send/receive characters.
 *
 * Perform Uart IOCTL for the following:
 *     Set/Get the current baud rate,
 *     set parity,
 *     set the number of Stop bits,
 *     set the character Length (5,6,7,8),
 *     enable/disable Hardware flow control.
 *
 * Only Polled mode is supported for now.

Intel(r) IXP425 Software Release

*

* = LIBRARY

OSSL - Operating System Services Library

*

* = MODULE

```

*      OSSL  Abstraction layer header file
*
* = FILENAME
*      ix_oss1.h (Replaced by OSAL)
*
* = DESCRIPTION
* This file contains the prototypes of OS-independent wrapper
* functions which allow the programmer not to be tied to a specific
* operating system. The OSSL functions can be divided into three classes:
*
* 1) synchronization-related wrapper functions around thread system calls
* 2) thread-related wrapper functions around thread calls
* 3) transactor/workbench osapi calls -- defined in osApi.h
*
* Both 1 and 2 classes of functions provide Thread Management, Thread
* Synchronization, Mutual Exclusion and Timer primitives. Namely,
* creation and deletion functions as well as the standard "wait" and
* "exit". Additionally, a couple of utility functions which enable to
* pause the execution of a thread are also provided.
*
* The 3rd class provides a slew of other OSAPI functions to handle
* Transactor/WorkBench OS calls.
*
*
* OSSL Thread APIs:
*      The OSSL thread functions that allow for thread creation,
*      get thread id, thread deletion and set thread prioirty.
*
*      ix_oss1_thread_create
*      ix_oss1_thread_get_id
*      ix_oss1_thread_exit
*      ix_oss1_thread_kill
*      ix_oss1_thread_set_priority
*      ix_oss1_thread__delay
*
* OSSL Semaphore APIs:
*      The OSSL semaphore functions that allow for initialization,
*      posting, waiting and deletion of semaphores.
*
*      ix_oss1_sem_init
*      ix_oss1_sem_fini
*      ix_oss1_sem_take
*      ix_oss1_sem_give
*      ix_oss1_sem_flush
*
* OSSL Mutex APIs:
*      The OSSL wrapper functions that allow for initialization,
*      posting, waiting and deletion of mutexes.
*
*      ix_oss1_mutex_init

```

```

*          ix_oss1_mutex_fini
*          ix_oss1_mutex_lock

 *****
 *
 * Lots of code copied from:
 *
 * m8xx_pcmcia.c - Linux PCMCIA socket driver for the mpc8xx series.
 * (C) 1999-2000 Magnus Damm <damm@bitsmart.com>
 *
 * "The ExCA standard specifies that socket controllers should provide
 * two IO and five memory windows per socket, which can be independently
 * configured and positioned in the host address space and mapped to
 * arbitrary segments of card address space. " - David A Hinds. 1999
 *
 * This controller does not meet the ExCA standard.
 *
 * m8xx pcmcia controller brief info:
 * + 8 windows (attrib, mem, i/o)
 * + up to two slots (SLOT_A and SLOT_B)
 * + inputpins, outputpins, event and mask registers.
 * - no offset register. sigh.
 *
```

```
* Because of the lacking offset register we must map the whole card.
* We assign each memory window PCMCIA_MEM_WIN_SIZE address space.
* Make sure there is (PCMCIA_MEM_WIN_SIZE * PCMCIA_MEM_WIN_NO
* * PCMCIA_SOCKETS_NO) bytes at PCMCIA_MEM_WIN_BASE.
* The i/o windows are dynamically allocated at PCMCIA_IO_WIN_BASE.
* They are maximum 64KByte each...
*/

/*
 * USB device controllers have lots of quirks. Use these macros in
 * gadget drivers or other code that needs to deal with them, and which
 * autoconfigures instead of using early binding to the hardware.
 *
 * This SHOULD eventually work like the ARM mach_is_*() stuff, driven by
 * some config file that gets updated as new hardware is supported.
 * (And avoiding all runtime comparisons in typical one-choice configs!)
 *
 * NOTE: some of these controller drivers may not be available yet.
 * Some are available on 2.4 kernels; several are available, but not
 * yet pushed in the 2.6 mainline tree.
 *
 * Ported to U-boot by: Thomas Smits <ts.smits@gmail.com> and
 * Remy Bohmer <linux@bohmer.net>

*
* cramfs interfaces to the uncompression library. There's really just
* three entrypoints:
*
* - cramfs_uncompress_init() - called to initialize the thing.
* - cramfs_uncompress_exit() - tell me when you're done
* - cramfs_uncompress_block() - uncompress a block.
*
* NOTE NOTE NOTE! The uncompression is entirely single-threaded. We
```

```
* only have one stream, and we'll initialize it only once even if it
* then is used by multiple filesystems.

*
*
* Very simple lz77-ish encoder.
```

```
*
* Theory of operation: Both encoder and decoder have a list of "last
* occurrences" for every possible source-value; after sending the
* first source-byte, the second byte indicated the "run" length of
* matches
*
* The algorithm is intended to only send "whole bytes", no bit-messing.
*

```

```
/*
 * linux/byteorder_generic.h
 * Generic Byte-reordering support
```

```
*
* Francois-Rene Rideau <fare@tunes.org> 19970707
*   gathered all the good ideas from all asm-foo/byteorder.h into one file,
*   cleaned them up.
*   I hope it is compliant with non-GCC compilers.
*   I decided to put __BYTEORDER_HAS_U64__ in byteorder.h,
*   because I wasn't sure it would be ok to put it in types.h
*   Upgraded it to 2.1.43
* Francois-Rene Rideau <fare@tunes.org> 19971012
*   Upgraded it to 2.1.57
*   to please Linus T., replaced huge #ifdef's between little/big endian
*   by nestedly #include'd files.
* Francois-Rene Rideau <fare@tunes.org> 19971205
*   Made it to 2.1.71; now a facelift:
*   Put files under include/linux/byteorder/
*   Split swab from generic support.
*
* TODO:
*   = Regular kernel maintainers could also replace all these manual
*   byteswap macros that remain, disseminated among drivers,
*   after some grep or the sources...
*   = Linus might want to rename all these macros and files to fit his taste,
*   to fit his personal naming scheme.
*   = it seems that a few drivers would also appreciate
*   nybble swapping support...
*   = every architecture could add their byteswap macro in asm/byteorder.h
*   see how some architectures already do (i386, alpha, ppc, etc)
*   = cpu_to_beXX and beXX_to_cpu might some day need to be well
*   distinguished throughout the kernel. This is not the case currently,
*   since little endian, big endian, and pdp endian machines needn't it.
*   But this might be the case for, say, a port of Linux to 20/21 bit
*   architectures (and F21 Linux addict around?).
*/

/*
 * This file holds USB constants and structures that are needed for
 * USB device APIs. These are used by the USB device model, which is
 * defined in chapter 9 of the USB 2.0 specification and in the
 * Wireless USB 1.0 (spread around). Linux has several APIs in C that
 * need these:
 *
 * - the master/host side Linux-USB kernel driver API;
 * - the "usbfs" user space API; and
 * - the Linux "gadget" slave/device/peripheral side driver API.
 *
 * USB 2.0 adds an additional "On The Go" (OTG) mode, which lets systems
 * act either as a USB master/host or as a USB slave/device. That means
 * the master and slave side APIs benefit from working well together.
 *
 * There's also "Wireless USB", using low power short range radios for
 * peripheral interconnection but otherwise building on the USB framework.
 *
 * Note all descriptors are declared '__attribute__((packed))' so that:
 *
 * [a] they never get padded, either internally (USB spec writers
 *     probably handled that) or externally;
 *
 * [b] so that accessing bigger-than-a-bytes fields will never
 *     generate bus errors on any platform, even when the location of
 *     its descriptor inside a bundle isn't "naturally aligned", and
 *
 * [c] for consistency, removing all doubt even when it appears to
 *     someone that the two other points are non-issues for that
 *     particular descriptor type.

 *
 * Copyright © 2011 Parrot S.A.
 *
 * Author: Ivan Djelic <ivan.djelic@parrot.com>
 *
 * Description:
 *
 * This library provides runtime configurable encoding/decoding of binary
 * Bose-Chaudhuri-Hocquenghem (BCH) codes.
 *
 * Call init_bch to get a pointer to a newly allocated bch_control structure for
 * the given m (Galois field order), t (error correction capability) and
 * (optional) primitive polynomial parameters.
 *
 * Call encode_bch to compute and store ecc parity bytes to a given buffer.
 * Call decode_bch to detect and locate errors in received data.
 *
 * On systems supporting hw BCH features, intermediate results may be provided
 * to decode_bch in order to skip certain steps. See decode_bch() documentation
 * for details.
 *
 * Option CONFIG_BCH_CONST_PARAMS can be used to force fixed values of
 * parameters m and t; thus allowing extra compiler optimizations and providing
```

```

* better (up to 2x) encoding performance. Using this option makes sense when
* (m,t) are fixed and known in advance, e.g. when using BCH error correction
* on a particular NAND flash device.
*
* Algorithmic details:
*
* Encoding is performed by processing 32 input bits in parallel, using 4
* remainder lookup tables.
*
* The final stage of decoding involves the following internal steps:
* a. Syndrome computation
* b. Error locator polynomial computation using Berlekamp-Massey algorithm
* c. Error locator root finding (by far the most expensive step)
*
* In this implementation, step c is not performed using the usual Chien search.
* Instead, an alternative approach described in [1] is used. It consists in
* factoring the error locator polynomial using the Berlekamp Trace algorithm
* (BTA) down to a certain degree (4), after which ad hoc low-degree polynomial
* solving techniques [2] are used. The resulting algorithm, called BTZ, yields
* much better performance than Chien search for usual (m,t) values (typically
* m >= 13, t < 32, see [1]).
*
* [1] B. Biswas, V. Herbert. Efficient root finding of polynomials over fields
* of characteristic 2, in: Western European Workshop on Research in Cryptology
* - WEWoRC 2009, Graz, Austria, LNCS, Springer, July 2009, to appear.

 */
/*
 * ALGORITHM
 *

```

```
* The "deflation" process depends on being able to identify portions
* of the input text which are identical to earlier input (within a
* sliding window trailing behind the input currently being processed).
*
* The most straightforward technique turns out to be the fastest for
* most input files: try all possible matches and select the longest.
* The key feature of this algorithm is that insertions into the string
* dictionary are very simple and thus fast, and deletions are avoided
* completely. Insertions are performed at each input character, whereas
* string matches are performed only when the previous match ends. So it
* is preferable to spend more time in matches to allow very fast string
* insertions and avoid deletions. The matching algorithm for small
* strings is inspired from that of Rabin & Karp. A brute force approach
* is used to find longer strings when a small match has been found.
* A similar algorithm is used in comic (by Jan-Mark Wams) and freeze
* (by Leonid Broukhis).
* A previous version of this file used a more sophisticated algorithm
* (by Fiala and Greene) which is guaranteed to run in linear amortized
* time, but has a larger average cost, uses more memory and is patented.
* However the F&G algorithm may be faster for some highly redundant
* files if the parameter max_chain_length (described below) is too large.
```

```
* ACKNOWLEDGEMENTS
```

```
* The idea of lazy evaluation of matches is due to Jan-Mark Wams, and
* I found it in 'freeze' written by Leonid Broukhis.
* Thanks to many people for bug reports and testing.

 */
/*
 * ALGORITHM
 *
 * The "deflation" process uses several Huffman trees. The more
 * common source values are represented by shorter bit sequences.
 *
 * Each code tree is stored in a compressed form which is itself
 * a Huffman encoding of the lengths of all the code strings (in
 * ascending order by source values). The actual code strings are
 * reconstructed from the lengths in the inflate process, as described
 * in the deflate specification.

/*
 * General Description:
 *
 * The user interface supports commands for BOOTP, RARP, and TFTP.
 * Also, we support ARP internally. Depending on available data,
 * these interact as follows:
 *
 * BOOTP:
 *
 * Prerequisites: - own ethernet address
```

```
*      We want:          - load the boot file
*      Next step:        none
*
* SNTP:
*
*      Prerequisites:    - own ethernet address
*                        - own IP address
*      We want:          - network time
*      Next step:        none
*/

./tools/kernel-doc/docproc.c
docproc.c
```

```
/*
* docproc is a simple preprocessor for the template files
* used as placeholders for the kernel internal documentation.
* docproc is used for documentation-frontend and
* dependency-generator.
* The two usages have in common that they require
* some knowledge of the .tmpl syntax, therefore they
* are kept together.
*
* documentation-frontend
* Scans the template file and call kernel-doc for
* all occurrences of ![EIF]file
* Beforehand each referenced file is scanned for
* any symbols that are exported via these macros:
* EXPORT_SYMBOL(), EXPORT_SYMBOL_GPL(), &
* EXPORT_SYMBOL_GPL_FUTURE()
* This is used to create proper -function and
* -nofunction arguments in calls to kernel-doc.
* Usage: docproc doc file.tmpl
*
* dependency-generator:
* Scans the template file and list all files
* referenced in a format recognized by make.
* Usage: docproc depend file.tmpl
* Writes dependency information to stdout
* in the following format:
* file.tmpl src.c src2.c
* The filenames are obtained from the following constructs:
* !Efilename
* !Ifilename
* !Dfilename
```

```
*          !Ffilename
*          !Pfilename
*
