*
* Modifications:
* 16-Sep-1996 RMK      Inlined the inx/outx functions & optimised for both
*                    constant addresses and variable addresses.
* 04-Dec-1997 RMK      Moved a lot of this stuff to the new architecture
*                    specific IO header files.
* 27-Mar-1999 PJB      Second parameter of memcpy_toio is const..
* 04-Apr-1999 PJB      Added check_signature.
* 12-Dec-1999 RMK      More cleanups
* 18-Jun-2000 RMK      Removed virt_to_* and friends definitions

```

```
/* These Blackfins all have a Boot ROM that is not reusable (at all):
```

```
 * BF531 / BF532 / BF533
```

```
 * BF538 / BF539
```

```
 * BF561
```

```
 * So there is nothing for us to export ;(
```

```
 *
```

```
 * These Blackfins started to roll with the idea that the Boot ROM can
```

```
 * provide useful functions, but still only a few (and not really useful):
```

```
 * BF534 / BF536 / BF537
```

```
 *
```

```
 * Looking forward, Boot ROM's on newer Blackfins have quite a few
```

```
 * nice entry points that are usable at runtime and beyond. We'll
```

```
 * only define known legacy parts (listed above) and otherwise just
```

```
 * assume it's a newer part.
```

```
 *
```

```
 * These entry points are accomplished by placing a small jump table at
```

```
 * the start of the Boot ROM. This way the addresses are fixed forever.
```

```

 *
 * Modifications:
 * 16-Sep-1996 RMK      Inlined the inx/outx functions & optimised for both
 *                    constant addresses and variable addresses.
 * 04-Dec-1997 RMK      Moved a lot of this stuff to the new architecture
 *                    specific IO header files.
 * 27-Mar-1999 PJB      Second parameter of memcopy_toio is const..
 * 04-Apr-1999 PJB      Added check_signature.
```

```
* 12-Dec-1999 RMK      More cleanups
* 18-Jun-2000 RMK      Removed virt_to_* and friends definitions
*/

/*-----+
```

```
*
 * File Name:   405gp_pci.c
 *
 * Function:    Initialization code for the 405GP PCI Configuration regs.
 *
 * Author:     Mark Game
 *
 * Change Activity-
 *
 * Date        Description of Change                                BY
 * -----
 * 09-Sep-98   Created                                              MCG
 * 02-Nov-98   Removed External arbiter selected message           JWB
 * 27-Nov-98   Zero out PTMBAR2 and disable in PTM2MS              JWB
 * 04-Jan-99   Zero out other unused PMM and PTM regs. Change bus scan
 *             from (0 to n) to (1 to n).                          MCG
 * 17-May-99   Port to Walnut                                       JWB
 * 17-Jun-99   Updated for VGA support                              JWB
 * 21-Jun-99   Updated to allow SRAM region to be a target from PCI bus
 *             JWB
 * 19-Jul-99   Updated for 405GP pass 1 errata #26 (Low PCI subsequent
 *             target latency timer values are not supported).     MCG
 *             Should be fixed in pass 2.
 * 09-Sep-99   Removed use of PTM2 since the SRAM region no longer needs
 *             to be a PCI target. Zero out PTMBAR2 and disable in PTM2MS.
 *             JWB
 * 10-Dec-99   Updated PCI_Write_CFG_Reg for pass2 errata #6      JWB
 * 11-Jan-00   Ensure PMMxMAs disabled before setting PMMxLAs. This is not
```

```

*      really required after a reset since PMMxMAS are already
*      disabled but is a good practice nonetheless.
*      stefan.roese@esd-electronics.com
*      12-Jun-01
*      - PCI host/adapter handling reworked
*      stefan.roese@esd-electronics.com
*      09-Jul-01
*      - PCI host now configures from device 0 (not 1) to max_dev,
*      (host configures itself)
*      - On CPCI-405 pci base address and size is generated from
*      SDRAM and FLASH size (CFG regs not used anymore)
*      - Some minor changes for CPCI-405-A (adapter version)
*      stefan.roese@esd-electronics.com
*      14-Sep-01
*      - CONFIG_PCI_SCAN_SHOW added to print pci devices upon startup
*      stefan.roese@esd-electronics.com
*      28-Sep-01
*      - Changed pci master configuration for linux compatibility
*      (no need for bios_fixup() anymore)
*      stefan.roese@esd-electronics.com
*      26-Feb-02
*      - Bug fixed in pci configuration (Andrew May)
*      - Removed pci class code init for CPCI405 board
*      stefan.roese@esd-electronics.com
*      15-May-02
*      - New vga device handling
*      stefan.roese@esd-electronics.com
*      29-May-02
*      - PCI class code init added (if defined)

 * Modifications:
 * 16-Sep-1996 RMK      Inlined the inx/outx functions & optimised for both
 *                    constant addresses and variable addresses.
 * 04-Dec-1997 RMK      Moved a lot of this stuff to the new architecture
 *                    specific IO header files.
 * 27-Mar-1999 PJB      Second parameter of memcpy_toio is const..
 * 04-Apr-1999 PJB      Added check_signature.
 * 12-Dec-1999 RMK      More cleanups
 * 18-Jun-2000 RMK      Removed virt_to_* and friends definitions

 */

./arch/sh/include/asm/unaligned-sh4a.h
unaligned-sh4a.h
/*
 * SH-4A has support for unaligned 32-bit loads, and 32-bit loads only.
 * Support for 64-bit accesses are done through shifting and masking
 * relative to the endianness. Unaligned stores are not supported by the
 * instruction encoding, so these continue to use the packed
 * struct.
 *
 * The same note as with the movli.l/movco.l pair applies here, as long
 * as the load is guaranteed to be inlined, nothing else will hook in to
 * r0 and we get the return value for free.
 *
 * NOTE: Due to the fact we require r0 encoding, care should be taken to
 * avoid mixing these heavily with other r0 consumers, such as the atomic

```

```
* ops. Failure to adhere to this can result in the compiler running out
* of spill registers and blowing up when building at low optimization
* levels. See http://gcc.gnu.org/bugzilla/show\_bug.cgi?id=34777.

./arch/x86/include/asm/e820.h

e820.h

```
/*
 * Legacy E820 BIOS limits us to 128 (E820MAX) nodes due to the
 * constrained space in the zeropage. If we have more nodes than
 * that, and if we've booted off EFI firmware, then the EFI tables
 * passed us from the EFI firmware can list more nodes. Size our
 * internal memory map tables to have room for these additional
 * nodes, based on up to three entries per node for which the
 * kernel was built: MAX_NUMNODES == (1 << CONFIG_NODES_SHIFT),
 * plus E820MAX, allowing space for the possible duplicate E820
 * entries that might need room in the same arrays, prior to the
 * call to sanitize_e820_map() to remove duplicates. The allowance
 * of three memory map entries per node is "enough" entries for
 * the initial hardware platform motivating this mechanism to make
 * use of additional EFI map entries. Future platforms may want
 * to allow more than three entries per node or otherwise refine
 * this size.
 */

```
* any later version.
*
* This file provides support for the ngPIXIS, a board-specific FPGA used on
* some Freescale reference boards.
*
* A "switch" is black rectangular block on the motherboard. It contains
* eight "bits". The ngPIXIS has a set of memory-mapped registers (SWx) that
* shadow the actual physical switches. There is also another set of
* registers (ENx) that tell the ngPIXIS which bits of SWx should actually be
* used to override the values of the bits in the physical switches.
*
* The following macros need to be defined:
*
* PIXIS_BASE - The virtual address of the base of the PIXIS register map
*
* PIXIS_LBMAP_SWITCH - The switch number (i.e. the "x" in "SWx"). This value
* is used in the PIXIS_SW() macro to determine which offset in
* the PIXIS register map corresponds to the physical switch that controls
* the boot bank.
*
* PIXIS_LBMAP_MASK - A bit mask the defines which bits in SWx to use.
*
* PIXIS_LBMAP_SHIFT - The shift value that corresponds to PIXIS_LBMAP_MASK.
*
* PIXIS_LBMAP_ALT_BANK - The value to program into SWx to tell the ngPIXIS to
* boot from the alternate bank.
